TI New cDNA polynucleotide encoding a thermal hysteresis protein which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily, useful for providing antifreeze protection to improve the quality of food.

AN 2002-090137 [12] WPIDS

AB

WO 200194378 A UPAB: 20020221

NOVELTY - A cDNA polynucleotide (I) comprising a nucleotide sequence for encoding a thermal hysteresis protein which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) a mRNA polynucleotide (II) comprising a nucleotide sequence for encoding thermal hysteresis proteins derived from the Tenebrionoidea Superfamily transcribed from (I);
- (2) a DNA or RNA probe having a sequence complementary or identical to a sequence of contiguous nucleotides for at least a portion of (I);
  - (3) a recombinant vector containing (I);
- (4) a thermal hysteresis protein, preferably an endogenous Type III anti-freeze proteins, derived from the Tenebrionoidea Superfamily which lowers the freezing point of a solution without effecting the melting point of the solution;
- (5) a consensus sequence with a nucleotide sequence selected from one of the four 481 nucleotide sequences (S1-S4) defined in the specification;
- (6) a consensus sequence with an amino acid sequence selected from the 133 (S5), 134 (S6), another 134 (S7), another 134 (S8) amino acid sequence defined in the specification;
- (7) a consensus sequence with the 133 amino acid sequence (S9) defined in the specification;
  - (8) a primer having a nucleotide sequence selected from P1-P3;
- (9) a method (M1) for producing a polypeptide having antifreeze properties comprising forming a cloning vector with a Tm 12.86 family member gene encoding an antifreeze polypeptide, transferring genes of the cloning vector into DNA of host cell to create a transformed cell, expressing a mRNA sequence and a translated amino acid sequence from the recombinant expression vector, the sequence being isoforms of the Tm 12.86 T. molitor antifreeze polypeptide;
- (10) a method (M2) for providing antifreeze or recrystallization inhibition properties to a subject formulation comprising incorporating at least 0.1 micrograms to 1 mg of an activated polypeptide into 1 ml of a subject formulation to obtain recrystallization inhibition or 1 mg to 25 mg of the activated polypeptide into 1 ml of a subject formulation to thermal hysteresis;
  - (11) a Tm 12.86 antibody/antiserum;
- (12) a recrystallization inhibition method (M3) for determining the presence, relative concentration, and/or activity of thermal hysteresis proteins comprising providing a proteinaceous composition in a solvent to form a test solution, flash freezing the solution, raising the temperature of the frozen solution to an appropriate annealing temperature that allows for a partial melt, while limiting heterogeneity in ice grain sizes within the solution, maintaining the frozen solution at the annealing temperature for a length of time sufficient to allow for recrystallization, monitoring the ice crystal grain size changes over time, and determining the presence of functional thermal hysteresis proteins in the solution given the retention of significantly smaller ice crystal grain sizes relative to at least one control solution;
- (13) a method for quantitatively assessing the extent of recrystallization occurring in frozen foods, and the impact of solution additives to inhibit or limit recrystallization according to the process defined in M3; and
- (14) a method for quantitatively assessing and comparing the effectiveness of cryoprotective solutions on the extent of recrystallization occurring in cryopreserved cells, tissues, solutions and the like, according to the process defined in M3.

CGCGGATCCCTCACCGACGAACAG (Pi); GAGAGGATAACTAATTGAGCTCGCC (P2); and CGCGGATCCCTGACCGAGGCACAA (P3).

USE - The activated anti-freeze protein is incorporated into:

- (a) plant, produce or fish in an amount sufficient to provide antifreeze protection;
- (b) a region of a target tissue in an amount sufficient to provide antifreeze protein controlled limited tumor cell or target tissue cryoinjury during cryosurgery;
- (c) hypothermic solutions or bathing media to reduce cold damage in order to provide cryogenic or hypothermic preservation of cells and tissues by incorporating the protein into the cells, tissue, or cell membranes in a controlled amount sufficient to provide antifreeze protection;
- (d) de-icing formulations or used on surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, cosmetic products, machinery and plant surfaces; or
- (e) a food product in an amount sufficient to provide antifreeze protection to improve the quality of food by abating freezing of solutions, freezer burn, or degradation due to cold storage.

The polynucleotides for the activated protein are used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatization. The Tm 12.86 antibody/antiserum is used as a screening device to identify positive recombinant plaques containing cloned inserts capable in an expression vector system to produce recombinant products recognized by the antibody/antiserum. The Tm 12.86 antibody/antiserum which is also used as a screening device to screen cDNA libraries in an expression system, including cross-species cDNA libraries to identify homologous sequences in other species.

M3 is used for concurrent multiple sample testing of solutions which includes the 'sandwich' method; and application via a 96 well plate device (all claimed).

L3 ANSWER 2 OF 69 HCAPLUS COPYRIGHT 2003 ACS on STN

TI Cloning of **Tenebrio molitor** antifreeze protein cDNAs, their properties and recombinant expression, and application as recrystn. inhibition factors thereof

The invention provides protein and cDNA sequences for thermal AB hysteresis proteins (THPs) or antifreeze proteins (AFPs) derived from Tenebrio molitor, members of Tenebrionoidea Type AFP Tm12.86 multigene family which lower the f.p. of a soln. without effecting the m.p. These proteins include Tm12.86, Tm2.2, Tm3.4, Tm3.9, Tm7.5, Tm2.3, Tm12.84 and distantly related Tm13.17 (closely related to B1 assessory gland protein of T. molitor). The invention also discloses essential biochem. and cellular tools that make possible more direct cellular investigations, and an assessment of the relation between thermal hysteresis protein (THP) levels and antifreeze activity (both thermal hysteresis and recrystn. inhibition [RI]). Related methods for prepg. recombinant said proteins and for providing antifreeze or recrystn. inhibition properties to a subject formulation. The purified, expressed THP protein can be directly added to an aq. soln. to depress the f.p., or transformed organisms expressing THP can be added to items which will be stored frozen. Also provided is a recrystn. inhibition method for detg. the presence, relative concn., and/or activity of thermal hysteresis proteins comprising: providing a proteinaceous compn. in a solvent to form a test soln.; flash freezing said soln.; raising the temp. of the frozen soln. to an appropriate annealing temp. that allows for a partial melt, while limiting heterogeneity in ice grain sizes within said soln.; maintaining said frozen soln. at the annealing temp. for a length of time sufficient to allow for recrystn.; monitoring the ice crystal grain size changes over time; and detg. the presence of functional thermal hysteresis proteins in said soln. given the retention of significantly smaller ice crystal grain sizes relative to at least one control soln. These THP can be used for new techniques and compns. suitable for improving the preservation characteristics of org. materials at low temps., including storage of frozen foods, plasma, cells, plants, etc.

- L3 ANSWER 3 OF 69 HCAPLUS COPYRIGHT 2003 ACS on STN
- TI Properties and uses of **Tenebrio molitor** thermal

hysteresis (antifreeze) proteins (THP)

AB Thermal hysteresis (antifreeze) proteins (THP) that have up to 100 times the specific activity of fish antifreeze proteins have been isolated and purified from the common yellow mealworm beetle, **Tenebrio** molitor. **Tenebrio** molitor is a

freeze-tolerant pest of stored grains in temperate regions, and it is the thermal hysteresis activity of their hemolymph that allows the insects to depress their f.ps. in the presence of ice or ice nucleators. Internal sequencing of the proteins, leading to cDNA cloning and prodn. of the protein in bacteria, has confirmed the identity and activity of the 8.4 to 10.7 kDa THP. THPs are Thr- and Cys-rich proteins composed largely of 12-amino-acid repeats of Cys-Thr-Xaa-Ser-Xaa-Xaa-Cys-Xaa-Xaa-Ala-Xaa-Thr. At a concn. of 55 .mu.g/mL, the THP depressed the f.p. 1.6 .degree.C below the m.p., and at a concn. of .apprx.1 mg/mL the THP or its variants can account for the 5.5 .degree.C of thermal hysteresis found in Tenebrio larvae. THPs function by an absorption-inhibition mechanism and produce oval-shaped ice crystals with curved prism faces. The purified, expressed THP protein can be directly added to an aq. soln. to depress the f.p., or transformed organisms expressing THP can be added to items which will be stored frozen. It is thus suggested that THP can be used for new techniques and compns. suitable for improving the preservation characteristics of org. materials at low temps., including storage of

frozen foods, drugs, plasma, cells, plants, etc. ACCESSION NUMBER: 1999:34995 HCAPLUS

- L3 ANSWER 4 OF 69 HCAPLUS COPYRIGHT 2003 ACS on STN
- TI Hyperactive antifreeze protein from beetles

AB The authors have purified and cloned 4 thermal hysteresis proteins from a fat body cDNA library which possess up to 100-times the specific activity of fish antifreeze proteins from the common yellow mealworm beetle Tenebrio Molitor. The proteins are threonine and cysteine rich, of relative mol. mass 8,400, composed largely of 12-amino acid repeats. It's estd. that a concn. of 1 mg/mL of this protein can account for the 5.5.degree.C of thermal hysteresis found in Tenebrio Molitor.

- L3 ANSWER 5 OF 69 USPATFULL on STN
- TI Human genes and gene expression products
- This invention relates to novel human polynucleotides and variants thereof; their encoded polypeptides and variants thereof, to genes corresponding to these polynucleotides and to proteins expressed by the genes. The invention also relates to diagnostic and therapeutic agents employing such novel human polynucleotides, their corresponding genes or gene products, e.g., these genes and proteins, including probes, antisense constructs, and antibodies.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

ANSWER 2 OF 47 USPATFULL on STN L5

Nucleic acid sequences encoding type III tenebrio antifreeze proteins тT

and method for assaying activity

A recrystallization inhibition method for determining the presence, AB

relative concentration, and/or activity of thermal

hysteresis proteins comprising: providing a proteinaceous composition in a solvent to form a test solution; flash freezing said solution; raising the temperature of the frozen solution to an appropriate annealing temperature that allows for a partial melt, while limiting heterogeneity in ice grain sizes within said solution; maintaining said frozen solution at the annealing temperature for a length of time sufficient to allow for recrystallization; monitoring the ice crystal grain size changes over time; and determining the presence of functional thermal hysteresis proteins in said

solution given the retention of significantly smaller ice crystal grain sizes relative to at least one control solution.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L5 ANSWER 3 OF 47 DGENE COPYRIGHT 2003 THOMSON DERWENT on STN TТ New cDNA polynucleotide encoding a thermal hysteresis protein which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily, useful for providing antifreeze protection to improve the quality of food -AN AAU76232 Protein **DGENE** This invention relates to a cDNA polynucleotide comprising a AB nucleotide sequence encoding a thermal hysteresis protein (THP) which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily. Anti- freeze proteins lower the freezing point of a solution without affecting the melting point of the solution. An activated anti-freeze protein may be incorporated into plant, produce or fish in an amount sufficient to provide antifreeze protection or in a region of a target tissue to provide antifreeze protein to limit tumour cell or target tissue cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in order to provide cryogenic or hypothermic preservation of cells and tissues. The proteins may be used as de-icing formulations or used on surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, machinery and plant surfaces or as a food product to improve the quality of food by abating freezing of solutions, freezer burn, or degradation due to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatisation. The Tm 12.86 antibody/antiserum which is also used as a screening device to screen cDNA libraries in an expression system, including cross-species cDNA libraries to identify homologous sequences in other species. The present sequence represents the Tm 13.17 clone/his tag fusion protein of the invention. This cDNA was created to facilitate purification of the Tm 13.17 protein and to try to enhance the anti-freeze activity of the recombinant protein. Note: This sequence differs from the sequence given in figure 5.11 for the Tm 13.17 clone/His tag fusion protein. Tm 3.9 clone/His tag fusion protein. DESCRIPTION:

ANSWER 9 OF 47 DGENE COPYRIGHT 2003 THOMSON DERWENT on STN L5

New cDNA polynucleotide encoding a thermal TIhysteresis protein which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily, useful

for providing antifreeze protection to improve the quality of food -

AAU10051 Protein ANDGENE

This invention relates to a cDNA polynucleotide comprising a AB

nucleotide sequence encoding a thermal hysteresis protein (THP) which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily. Anti- freeze proteins lower the freezing point of a solution without affecting the melting point of the solution. An activated anti-freeze protein may be incorporated into plant, produce or fish in an amount sufficient to provide antifreeze protection or in a region of a target tissue to provide antifreeze protein to limit tumour cell or target tissue cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in order to provide cryogenic or hypothermic preservation of cells and tissues. The proteins may be used as de-icing formulations or used on surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, machinery and plant surfaces or as a food product to improve the quality of food by abating freezing of solutions, freezer burn, or degradation due to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatisation. The Tm 12.86 antibody/antiserum which is also used as a screening device to screen cDNA libraries in an expression system, including cross-species cDNA libraries to identify homologous sequences in other species. The present sequence represents the Tm 3.4 clone/his tag fusion protein minus the signal peptide of the invention. This cDNA was created to try to enhance the anti-freeze activity of the recombinant protein.

New cDNA polynucleotide encoding a thermal ΤI hysteresis protein which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily, useful for providing antifreeze protection to improve the quality of food -

AN AAU10036 Protein DGENE

This invention relates to a cDNA polynucleotide comprising a AB nucleotide sequence encoding a thermal hysteresis protein (THP) which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily. Anti- freeze proteins lower

the freezing point of a solution without affecting the melting point of the solution. An activated anti-freeze protein may be incorporated into plant, produce or fish in an amount sufficient to provide antifreeze protection or in a region of a target tissue to provide antifreeze protein to limit tumour cell or target tissue cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in order to provide cryogenic or hypothermic preservation of cells and tissues. The proteins may be used as de-icing formulations or used on surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, machinery and plant surfaces or as a food product to improve the quality of food by abating freezing of solutions, freezer burn, or degradation due to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatisation. The Tm 12.86 antibody/antiserum which is also used as a screening device to screen cDNA libraries in an expression system, including cross-species cDNA libraries to identify homologous sequences in other species. The present sequence represents the Tml3.17 anti-freeze protein of the invention.

This invention relates to a cDNA polynucleotide comprising a nucleotide sequence encoding a thermal hysteresis protein (THP) which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily. Anti- freeze proteins lower the freezing point of a solution without affecting the melting point of the solution. An activated anti-freeze protein may be incorporated into plant, produce or fish in an amount sufficient to provide antifreeze protection or in a region of a target tissue to provide antifreeze protein to limit tumour cell or target tissue cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in order to provide cryogenic or hypothermic preservation of cells and tissues. The proteins may be used as de-icing formulations or used on surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, machinery and plant surfaces or as a food product to improve the quality of food by abating freezing of solutions, freezer burn, or degradation due to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatisation. The Tm 12.86 antibody/antiserum which is also used as a screening device to screen cDNA libraries in an expression system, including cross-species cDNA libraries to identify homologous sequences in other species. The present sequence represents a cDNA encoding the Tm 3.9 clone/his tag fusion protein minus the signal peptide of the invention. This cDNA was created to facilitate purification and to try to enhance the anti- freeze activity of the recombinant protein.

An activated anti-freeze protein may be incorporated into plant, produce or fish in an amount sufficient to provide antifreeze protection or in a region of a target tissue to provide antifreeze protein to limit tumour cell or target tissue cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in order to provide cryogenic or hypothermic preservation of cells and tissues. The proteins may be used as de-icing formulations or used on surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, machinery and plant surfaces or as a food product to improve the quality of food by abating freezing of solutions, freezer burn, or degradation due to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatisation. The Tm 12.86 antibody/antiserum which is also used as a screening device to screen cDNA libraries in an expression system, including cross-species cDNA libraries to identify homologous sequences in other species. The present sequence represents a cDNA encoding the Tm 7.5 clone of the invention.

New cDNA polynucleotide encoding a thermal hysteresis protein which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily, useful for providing antifreeze protection to improve the quality of food -

AN AAS21113 cDNA DGENE This invention relates to a cDNA polynucleotide comprising a AB nucleotide sequence encoding a thermal hysteresis protein (THP) which is a Type III anti-freeze protein derived from the Tenebrionoidea Superfamily. Anti- freeze proteins lower the freezing point of a solution without affecting the melting point of the solution. An activated anti-freeze protein may be incorporated into plant, produce or fish in an amount sufficient to provide antifreeze protection or in a region of a target tissue to provide antifreeze protein to limit tumour cell or target tissue cryoinjury during cryosurgery. The proteins of the invention may also be used in hypothermic solutions or bathing media to reduce cold damage in order to provide cryogenic or hypothermic preservation of cells and tissues. The proteins may be used as de-icing formulations or used on surfaces to reduce existing ice buildup or abate the formation of ice buildup on surfaces such as a road, aircraft, household products, machinery and plant surfaces or as a food product to improve the quality of food by abating freezing of solutions, freezer burn, or degradation due to cold storage. The polynucleotides for the activated protein can be used to create transgenic or gene-modified plants, crops, fish, or animals having greater tolerance to cold climatisation. The Tm 12.86 antibody/antiserum

which is also used as a screening device to screen cDNA

libraries in an expression system, including cross-species cDNA

libraries to identify homologous sequences in other species. The present

sequence represents a cDNA encoding the Tm 3.9 clone

anti-freeze protein of the invention.
